RIPPING UP THE MAP

Criminology and Cartography Reconsidered

THEO KINDYNIS*

Criminologists have long been interested in mapping crime, yet their use and understanding of maps remain superficial and uncritical. This article traces crime mapping's historical development before considering the emergence of 'critical cartography' and exploring its implications for criminology. Criminologists are urged to interrogate conventional crime maps, and to investigate the criminological implications of emergent digital mapping technologies. Maps and map making afford a host of innovative methodologies that criminologists have yet to take advantage of, and some tentative suggestions are made as to how criminologists might utilize cartographic methods in order to generate unique empirical insights. Finally, the article considers how criminologists might harness maps' communicative power to better engage with the public and to promote social justice.

Keywords: crime mapping, critical cartography, cultural criminology, environmental criminology, space

Introduction

Criminologists have long been interested in mapping crime and, today, computer-aided crime mapping is used by police forces around the world (Chainey and Tompson 2008). Yet, despite crime mapping's burgeoning popularity in recent decades (Sharon 2006), criminology's use and understanding of maps, their production and application remain largely superficial and uncritical (see, e.g. Chainey and Ratcliffe 2005; Anselin *et al.* 2008; Boba Santos 2013; Hill and Paynich 2013). This article calls for criminologists to look at maps and map making anew, and to critically re-engage with cartography as an object of theoretical critique and inquiry; as a methodological toolkit; and as a vehicle for social and political intervention.

Beginning with a brief overview of the history of crime mapping, the article then considers the development of critical cartography; a constellation of theoretical critiques and new mapping practices that challenges how we think about maps, and which, it is argued, can provide a useful corrective to criminology's cartographic illiteracy. Also considered are the production and achievements of 'counter-maps' which reframe the world in such a way as to articulate alternative, subversive and marginalized interests.

The remainder of the article proceeds in three parts, exploring the implications of critical cartography for criminological theory, method, and social and political intervention, respectively. First, criminologists are urged to challenge conventional crime mapping's use and efficacy, and to interrogate its epistemological and ideological presumptions. Relatedly, it is argued that, as new forms of digital mapping become

* University of Greenwich, Old Royal Naval College, 30 Park Row, London, SE10 9LS, UK; kt25@gre.ac.uk.

increasing popular, cartography and its implication in crime, control and resistance should comprise a focus of criminological enquiry.

Second, it is argued that cartography affords a host of innovative methodologies that criminologists have yet to take advantage of. Despite the recent ‘spatial turn’ within criminology (see [Hayward 2004; 2012; Campbell 2013](#)), criminologists have so far been reluctant to explore the abundance of cartographic research opportunities at their disposal. Some tentative suggestions are made as to how criminologists might utilize maps and map making in order to generate unique empirical insights and yield other methodological advantages.

Finally, the article considers how criminologists might harness maps’ communicative power to better engage with the public and to promote social justice. Several examples are considered, which point towards innovative new approaches for action research and opportunities for more critically informed, political-engaged mappings of crime and its control. However, whilst socially progressive mappings give cause for optimism, criminologists must nevertheless remain vigilant against cartographies of intolerance and vindictiveness.

A Brief History of Crime Mapping

The history of crime mapping is punctuated by three defining moments. Ever since the first recognizable examples of crime maps were produced in the early nineteenth century by André-Michel Guerry and Adolphe Quetelet, following the publication in France of the first national crime statistics, cartography has maintained something of a flickering presence in criminology ([Courtright and Mutchnick 2002](#)). In many ways, Guerry and Quetelet’s *cartes thematiques* anticipated contemporary crime mapping, with areas shown shaded according to the rates of various categories of crime, as well as other socio-demographic features, such as poverty and education levels ([Beirne 1993; Wortley and Mazerolle 2008](#); see [Figure 1](#)). Importantly, Guerry and Quetelet’s maps showed that crimes were not evenly distributed but clustered geographically along with other observable social variables such as poverty and education levels, and that such patterns were consistent over time ([Courtright and Mutchnick 2002; Wortley and Mazerolle 2008; Hill and Paynich 2013](#)). Credited with founding what is now termed the ‘cartographic school’, Guerry and Quetelet’s methods formed the basis of a flourish of studies throughout the nineteenth century—perhaps the most well-known of which is [Mayhew’s \(1862\)](#) survey of London’s rookeries—as well as offering a direct challenge to Lombroso’s biological positivism ([Chainey and Ratcliffe 2005](#)).

The next substantial and somewhat more influential moment in the history of crime mapping, to which modern criminology’s fascination with charting the spatial distribution of crime can be more or less directly traced, is the work of the Chicago School sociologists in the 1920s and 1930s. The theoretical and empirical initiatives of the Chicago School and its legacy have been discussed at length elsewhere and need not be reiterated here (see, e.g. [Hayward 2013](#)). However, of particular relevance to the present discussion is the iconic significance of Ernest Burgess’s ‘concentric zone’ model ([Park et al. 1925](#)), arguably ‘the most famous diagram in social science’ ([Davis 1995](#)). Inherent in Burgess’s model is a particular *way of seeing* urban space which has endured for almost a century (see [Hayward 2004](#)): today, the concentric zone model remains the

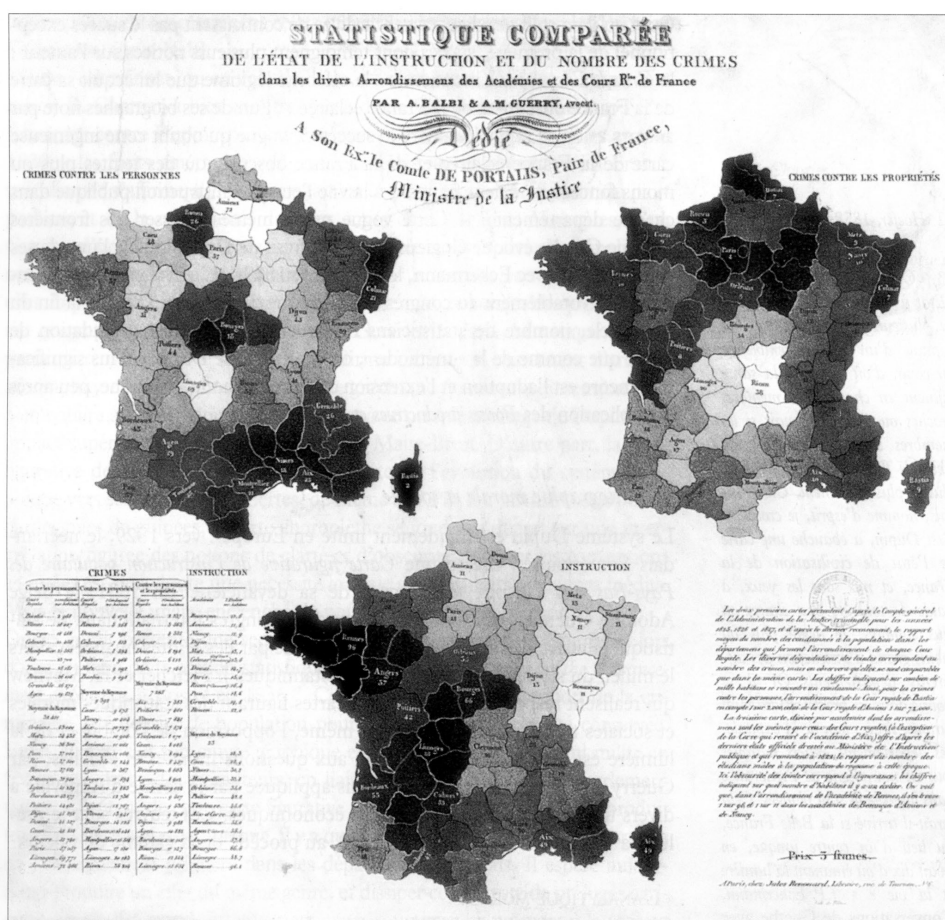

FIG. 1 Adriano Balbi and André Michel Guerry, 1829, Statistique comparée de l'état de l'instruction et du nombre des crimes dans les divers arrondissemens des Académies et des Cours R^{es} de France.

quintessential expression of criminology's conception of the city.¹ Schematic, rationalized and 'mappable from above' (Hayward 2004: 97), the model is emblematic of what the French philosopher and urban theorist, Michel de Certeau (1984), would later describe as the 'concept city': '... the city as seen by planners, developers, statisticians and, all too often, criminologists ... distilled to leave only quantitative data, demographics and rational discourse' (Hayward 2004: 2). Unfortunately, it is the School's superficial interpretation of urban space which has since predominated within criminology, having 'set the geography of crime down a ... narrow conceptual path from which it has rarely deviated' (Hayward 2012: 443).

¹ As Hayward notes, the School's appreciative focus, exemplified by groundbreaking ethnographic studies such as Anderson's *The Hobo*, 'increasingly fell victim to outside policy influence and rational abstraction ... a road that led ultimately to the creation of disciplinary variants such as environmental and administrative criminology' (Hayward 2012: 445).

The next significant development in crime mapping occurred during the late 1970s and 1980s when the so-called ‘second wave’ of environmental criminology reinvigorated interest in the spatial distribution of crime (Hayward 2004). In the following decade, developments in computerized mapping software, the availability of affordable hardware and the digitization of police records heralded a new era of ‘desktop’ crime mapping (Chainey 2009). Today, digital crime mapping software is used by police forces around the world to identify crime ‘hot spots’ and to target resources where they are apparently most needed (see, e.g. the volume edited by Chainey and Tompson 2008). Recent developments include acoustic gunshot detection systems, which use hidden microphones and sensors to triangulate and alert the police to the location of gunshots in real time, and predictive crime mapping software, which enables police to identify ‘prospective hot spots’ (Bowers *et al.* 2004; see www.predpol.com). Perhaps most significantly, however, recent years have seen a growing trend in the publication of crime maps on the internet, often hosted on the websites of police departments, and increasingly in an interactive format (Ratcliffe 2002; see, e.g. www.police.uk or maps.met.police.uk).

Critical Cartography

Crime mapping is now arguably *the* growth industry in criminology, with its own dedicated journal (*Crime Mapping*), hundreds of books published on the subject and a plethora of commercially available software applications (Byrne and Pease 2011: 361; see, e.g. Weisburd and McEwen 1998; Hirschfield and Bowers 2001; Murray *et al.* 2001). Yet, despite crime mapping’s growing popularity in recent decades (Sharon 2006), criminology’s use and understanding of maps, their production and application remain superficial and largely uncritical (see, e.g. Chainey and Ratcliffe 2005; Anselin *et al.* 2008; Boba Santos 2013; Hill and Paynich 2013).

Meanwhile, recent years have seen the development of critical cartography: a perspective that applies the lessons of critical theory to how we think about maps, and which can provide a useful corrective to criminology’s cartographic short-sightedness. A host of academic, artistic and activist contributions have challenged the authority of conventional cartography, through both theoretical critique and through new and imaginative mapping practices (Wood and Fels 1986; Harley 1989; Crampton and Krygier 2006; see, e.g. Bhagat and Mogel 2008; Crampton 2010; Wood *et al.* 2010; Kitchin *et al.* 2011). In what follows, I consider, first of all, the emergence and nature of this theoretical critique. I then discuss the practice of ‘counter-mapping’ and its potential as a tool for bolstering the territorial claims of indigenous and marginalized populations, and contesting dominant narratives.

The power of maps: theoretical and political critiques of cartography²

Although critique and contestation have accompanied cartography since its inception as a discipline, contemporary critical cartography as a more or less unified body of critique rose to prominence during the 1990s (Crampton and Krygier 2006). Catalysed by

² I allude here to Dennis Wood’s *The Power of Maps* (1992), an early and influential work of critical cartography.

the critical debate surrounding the growing use of Geographic Information Systems, geographers began to pay increasing attention to how maps privilege certain ways of seeing and support dominant political structures (Schuurman 2000; Crampton and Krygier 2006). Around the turn of the decade, a constellation of theoretical critiques began to call into question the presumptions of professional and academic cartography, and to address the political implications of mapping (see, e.g. Harley 1988; 1989; [1991] 2001; Harley and Woodward 1987; Wood 1992). This nascent perspective challenged conventional geographical understandings of maps as neutral scientific documents, instead interpreting maps as instruments of government, social constructions and inscriptions of knowledge and authority (Crampton and Krygier 2006).

Critical cartography has called attention to the ways in which maps and map making are enrolled as instruments of state control, and implicated in struggles over territory, identity and meaning (Kitchin *et al.* 2011). Historically and contemporarily, mapping has played an instrumental role in Western imperial domination and exploitation. By rendering distant territories ‘knowable, navigable and claimable’, maps have allowed military and commercial power to be wielded efficiently and effectively from afar (Kitchin *et al.* 2011: 390; see Latour 1987). In addition, the ‘cartographic gaze’—a way of seeing implied by the dehumanizing and rationalizing visual grammar of cartographic abstraction, and which renders the complexity of human life as mere dots—allows those in power to take action without witness to its human consequences (Pickles 2004; Kitchin *et al.* 2011: 390). Moreover, once a territory is occupied, colonizers’ maps erase the presence and territorial claims of subjugated indigenous populations. In the partition of India (Kalpagam 1995), the ‘terra nullius’ of Australia (Gibson 1999), and the annexation of Palestinian land (Tawil-Souri 2012), cartography has been integral to colonial coercion (Harley 1988). Today, mapping practices—from real-time surveillance and ‘strip mapping’ by unmanned aerial vehicles (UAVs) or ‘drones’, to the Pentagon’s new ‘cartography of enmity’ (Shapiro 2007; see Barnett 2004)—remain essential to contemporary geopolitical conflicts (Raza 2012: 182).

Alongside its complicity in colonial, imperialist and capitalist domination, cartographic mapping has long been a key strategy within states’ internal regimes of governmentality (Rose-Redwood 2006). ‘To govern,’ says Rose, ‘it is necessary to render visible the space over which government is to be exercised’ (Rose 1999: 36). In theoretical terms, mapping can be said to be concerned with the institution of what Deleuze and Guattari (1987) term ‘striated space’: ‘... a space within which movements and flows are regulated in ways which enable authorities to act; a space that is measured, directed and standardized’ (Barry 1996: 127–8). In fact, cartography has long facilitated surveillance and control by both the state and capital (Harley 1989: 12). Since the early nineteenth century, states have used maps in their assessment and management of population and resources, and their distribution across territory (Crampton 2010). Meanwhile, the production, ordering and inscription of cartographic space have ‘historically been related to the ... processes of capital accumulation, the circulation of commodities, and the creative destruction of urban landscapes’ (Rose-Redwood 2006: 470–1). Today, mapping practices remain central to the politics of the production (and consumption) of urban space (Graham 2005). To give a contemporary example, the geodemographic profiling of individuals and neighbourhoods—‘fitting them into idealised consumer types, fixing them into a spatial grid of quantifiable economic value and ranking them based on their “worth” or “risk”’ (Kitchin *et al.* 2011: 391)—reifies

and exacerbates social and spatial differences and easily leads to the discriminatory process of ‘redlining’, whereby areas deemed unprofitable or high risk are denied services (Pickles 1995; Graham 2005). Furthermore, recent developments in mapping and GIS technologies offer unprecedented opportunities for new forms of surveillance and tracking (discussed below).

Besides power *external* to cartography—surveillance, for instance, is achieved *with* the help of maps—critical cartographers have also called attention to the ways in which power inheres *within*, or *internal* to, cartography itself: how power is ‘embedded in the map text’ (Harley 1989: 13) and ‘constituted in the very design and creation of maps’ (Kitchin *et al.* 2011: 390). Several scholars have argued that *all* maps are inherently ideologically loaded, reflecting the interests of their creators (see, e.g. Wood and Fels 1986; Harley 1989; Pickles 1992). Whilst we have been ‘indoctrinated into the conventions of cartographic sign systems’ and conditioned to read maps as ‘natural’, cartographers invariably ‘have to make a whole series of decisions regarding content, presentation, scale and so on’ (Kitchin *et al.* 2011: 390). Perhaps the most well-known and controversial example of maps’ embedded politics is the Mercator projection. Whilst it remains the most popular form of world map, the projection was originally devised in 1569, intended as a navigational aid for European sailors, and actually distorts the relative size and position of nations and continents (Monmonier 2004). Not only are Europe and North America shown to be much larger than they actually are, but the map places Europe literally at the centre of the world. Thus, the projection is arguably as much an inscription of European world domination as it is an accurate depiction of the Earth’s surface and, in misrepresenting the size of third world countries and continents, has arguably fostered European imperialist attitudes for centuries³ (see, e.g. Peters 1974; 1983; Wood 1992).

Power, then, is subtly constituted through even the most seemingly benign of maps: the school atlas (Kitchin *et al.* 2011: 390). All maps are inherently selective in what they communicate and ‘include all kinds of “silences” about other information’ (Kitchin *et al.* 2011: 390). Furthermore, by leaving certain oppressed and underprivileged social categories ‘off the map’, maps also reproduce specific power relations (see, e.g. Harley 1988; Matthews and Vujakovic 1995; Gleeson 1996; Winlow 2001; Brown and Knopp 2008). ‘Once it is accepted that certain conventions are “natural” or “normal”, the danger is that they acquire a coercive and manipulative authority’ (Harley [1991] 2001: 202). It is in this way that maps’ apparent objectivity belies their inherently ideological character.

Counter-mapping: critical cartography in practice

Critical cartography’s theoretical critique has been accompanied by experimentation with new and alternative mapping practices by a variety of actors from outside the academy: artists, activists, disenfranchised and minority groups, and other ‘non-experts’ (Crampton and Krygier, 2006). ‘Counter-mapping’ refers to the use of maps to reframe

³ The cultural and political significance of the Mercator projection and its subsequent rivals (such as the Gall-Peters and Robinson projections) remains the source of considerable controversy and debate (see, e.g. Crampton 1994; Monmonier 1995; Taylor 2004; Wood and Fels 1986).

the world in such a way as to challenge dominant power structures and to articulate alternative, progressive and even radical interests (Hodgson and Schroeder 2002; Kitchin *et al.* 2011). The creation of alternative, subversive maps is by no means a recent phenomenon: particularly well-known instances include the 1929 Surrealist map of the world (Figure 2) and the Situationists' psychogeographic guide to Paris (reproduced in Sadler 1999: 21). Both of these early counter-maps distort existing cartographies in order to contest official representations of space, yet, whilst witty and provocative, their impact is easily overstated: they remain vague in their political intent, and of negligible consequence.

More recent examples have, by contrast, yielded very real achievements (Wood *et al.* 2010: 111). During the 1990s, anthropologists and cartographers worked alongside indigenous Inuits in Canada to produce maps documenting their patterns of land use such as fishing sites, travel routes and settlement locations. These maps went on to play a key role in negotiations that would enable the Inuit to assert a territorial claim to the two million km² of Canada now known as Nunavut (Wood *et al.* 2010). The participatory mapping of indigenous lands in order to secure their tenure has since spread to other parts of the world including Southern Asia, Africa and Australia (see Chapin *et al.* 2005 for a review).

Since 2005, the United Nations has been mapping the restricted access to, physical enclosure and illegal occupation of the Palestinian territories in response to the ongoing violations of international humanitarian and human rights law by the Israeli Government (UNOCHA 2010). This project has established a powerful counter-narrative to Israel's rendering of the conflict; the maps produced hang in consulates and embassies around the world, affirming the reality of the occupation for the diplomatic corps and making it an inescapable topic (Wood *et al.* 2010: 247).

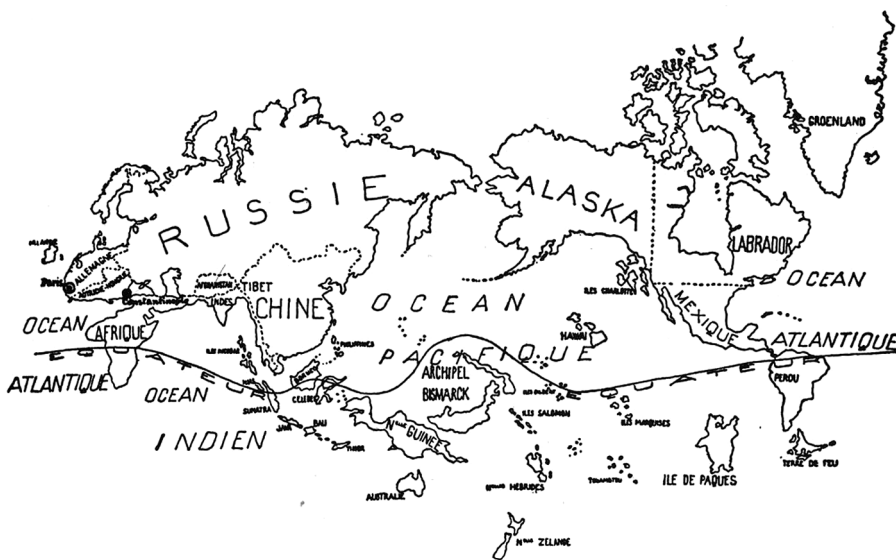

FIG. 2 Artist unknown, 1929, Surrealist Map of the World. From 'Le Surréalisme en 1929', special issue of *Variétés* (1929: 26–7).

Contrary to popular conceptions, then, maps are socio-political constructs, instruments of domination and government, and expressions of power and ideology. Yet they can also be powerful tools for social justice. In what follows, I suggest some ways in which criminology might critically re-engage with cartography: first, as an object of research and critique; second, as a methodological toolkit; and third, as a vehicle for social and political intervention.

Thinking Criminologically about Maps

Whilst other so-called ‘environmental’ criminologies have long met with ardent opposition, crime mapping has hitherto tended to elude criticism. First and foremost, then, a critical cartographic criminology—if we can imagine such a thing—must take conventional administrative crime mapping to task. Criminologists must not only challenge crime mapping’s use as a tool for crime analysis and law enforcement, but, by extending the analysis of critical cartography, move beyond conventional (albeit valid) criticisms of bias, inaccuracy and inefficacy, and interrogate crime mapping’s epistemological presuppositions, its latent political and ideological functions, and its aesthetic and semiotic grammar. Furthermore, mapping and its implication in crime, control and resistance should constitute an object of criminological enquiry in itself. In the remainder of this section, I consider these aspects in turn.

Even judged according to their own criteria, crime maps are often ‘worse than useless’ (Arthur 2011). To begin with, crime maps are dependent on police-recorded crime statistics rather than, for instance, the more authoritative British Crime Survey, and thus reflect the reporting of crime, police recording practices and insurance company policies, rather than any ‘true’ measure of crime, whatever that might entail (Jenkins 2011; see, e.g. Morrison 1995: Chapter 8). Furthermore, it is increasingly the case that it simply does not make sense to think about certain types of crime in terms of our conventional notions of space. Cybercrime, white-collar financial crime, transnational terrorism, fraud and identity theft all have very real local (and global) consequences, yet ‘take place’ within, through or across the ‘space of flows’ (Castells 1996). Such a-spatial or inter-spatial crime is invariably omitted from conventional crime maps. Moreover, even those illegalities that, crime maps would otherwise have us believe, neatly adhere to a set of geolocational coordinates are frequently misrepresented; clustered, for instance, according to the nearest residential postcode. Thus, a quiet residential street in Portsmouth appeared as a ‘war zone’ according to the Home Office’s online crime map after being misallocated crimes from a nearby shopping centre and neighbouring bars (Morris and Carter 2011).

Crime mapping is frequently touted as an indispensable aid to law enforcement, and has contributed to a veritable paradigm shift in policing (Sharon 2006). For these reasons, its strategic implications are also worth considering, particularly the targeted policing of so-called ‘hot spots’. Undoubtedly, the best-known instance of crime mapping’s operational use is the New York City Police Department’s COMPSTAT programme,⁴ heralded by many as the policing success story behind the New York ‘crime

⁴ Whilst COMPSTAT refers to the NYPD’s overall management and accountability system, crime mapping is integral to this process (Chainey and Ratcliffe 2005).

miracle' of the 1990s (Rosenbaum 2006; Muncie 2013). However, on closer scrutiny, the role of police strategy in explaining the crime drop appears less certain. Objective evaluations of the COMPSTAT process are limited (see, e.g. Kelling and Sousa 2001), since many 'assessments' have been written by persons deeply involved in the programme, and are essentially works of advocacy (Hoover 2013: 165; see, e.g. Bratton and Knobler 1998; Maple and Mitchell 1999; McDonald 2002).

Meanwhile, COMPSTATs critics argue that the crime decline is better explained by other factors including increasing imprisonment, the receding crack epidemic and broader demographic shifts (see, e.g. Levitt 2004). Regardless of its effectiveness, COMPSTAT's operationalization of 'broken windows' theory, coupled with New York's Giuliani-era brand of zero-tolerance policing, left a trail of 'collateral damage' in its wake, the brunt of which was borne by a politically powerless underclass (Howell 2009; Eterno and Silverman 2012; Muncie 2013). More generally, whilst a small number of evaluative studies suggest that hot spots policing can be effective in reducing crime (see, e.g. Koper 1995; Sherman and Weisburd 1995), others show that its impacts tend to be small, inconsistent and short-term (see Rosenbaum 2006 for a review).

At a more fundamental *epistemological* level, established crime mapping techniques—predicated on a Cartesian conception of space as an 'empty grid'—inevitably fail to capture the spatial dynamics of crime, as they reduce complex social phenomena to dots or shadings on a two-dimensional surface (Bear and Lee 2011). After all, crime and criminality do not exist as a scattering of discontinuous, static points, suspended in isolation; they have a history and a trajectory, an ambience (or aura?) that surrounds them in both time and space. Conventional dot distribution or choropleth crime maps show only those coordinates at which these trajectories, individual biographies or confluences of criminal 'opportunity' (Felson 1986; 1998)—once reported, recorded, categorized, classified and quantified, distilled into static data points—are 'assimilated into an administrative grid' (Scott 1998: 24). Moreover, as Rosenbaum points out, the implications of this superficial understanding of the interrelationship between space and crime extend to crime mapping's strategic use:

Rarely do we see a detailed analysis of the characteristics of the hot spot and the nature of the problem. How much can we really learn about the problem from the spatial distribution of calls about drug transactions, crime incidents, or arrests? ... The real problems are hidden behind the calls for service or arrest data. The real story is more complex, more dynamic, and more difficult to summarize. (Rosenbaum 2006: 248)

Beyond such epistemological inadequacy, crime mapping performs several insidious political and ideological functions. First, by rendering the city as an urban dystopia—a 'threatscape', depicted solely in terms of criminality—crime mapping legitimates the existing criminal justice apparatus (Wallace 2009). With no clues as to motivation, context or mitigating factors, crime is portrayed simply as 'the result of individual irrational predators' (Wallace 2009: 22). Moreover, digital crime maps are often 'hyper-local in the sense that the displayed results are only made meaningful at the highest level of zoom, in which individual streets rather than whole sections of the city can be seen' (Wallace 2009: 18). This privileges punitive street-level approaches to crime, to the neglect of macro-level social and political interventions, which might actually address crime's social, economic and cultural roots. All this is not to mention that crime maps invariably exclude many of the crimes of the powerful. Financial, corporate

and environmental crimes simply do not feature on conventional crime maps (Wallace 2009).

Second, whilst the decision to publicize crime maps is invariably rationalized in terms of community empowerment and police accountability (Jones 2009; Tompson and Chainey 2012), it can also be seen as an extension of what David Garland has termed 'responsibilization'. This is a process whereby the state attempts to shift responsibility for crime control onto non-state agencies, organizations and individuals (Garland 2001: 124–5). In this way, crime maps implicate citizen-users in their own safety and, in doing so, promote a neo-liberal agenda of individual responsibility (Wallace 2009).

All the while, crime maps maintain a persuasive, yet ultimately superficial, 'aesthetic of authority' (Ferrell 2009: 78). High-definition satellite imagery, geolocational coordinates and decimalized crime statistics all 'provide an assuring sense of precision and order' (Ferrell 2009: 78). According to an aesthetic or semiotic reading of the type popularized by cultural criminologists (Ferrell 2006; Ferrell *et al.* 2008), crime maps are best understood as 'symbolic performances of scientific objectivity' (Ferrell 2009: 78). It is interesting at this juncture to invoke Latour and Woolgar's (1979) notion of scientific diagrams and documents as *inscriptions*: '... material representations used in the production of scientific knowledge and evidence' (Finn 2009: xv). Of particular relevance here is that, according to Latour and Woolgar, once a scientific object or process is translated into a graphic-textural form, it assumes the status of irrefutable, visually objectified evidence (Born 1997; Latour 1987: 64–70). Thus, crime maps are not only traces of where crimes are alleged to have occurred, but 'proof' that they did (Wallace 2009).

'Postmodern cartography', crime and control

Besides advancing a critique of 'crime mapping' per se, it remains to critically theorize the broader criminological implications of a host of other contemporary mapping practices. Of particular relevance here is the proliferation of digital maps—what critical cartographers have referred to as the emergence of 'postmodern cartography' (Farman 2010) or 'maps 2.0' (Crampton 2009). To take one example, as of 2013, over one billion people were using Google Maps services every month (Choudhary 2013), and the Google Maps smartphone app was the most popular app in the world (Mari 2013). As digital maps become increasingly ubiquitous, mobile, immersive, interactive and user-generated, our relationship with cartography is undergoing a qualitative, paradigmatic shift. More and more, '*the boundary between consulting a map and interacting with the world outside it is blurring*' (Burkeman 2012, emphasis added). Maps are now interwoven with our everyday lives, implicated in crime and its control, and embroiled in political struggles as never before, yet this nexus has thus far been neglected by criminologists.

Importantly, new mapping technologies offer unprecedented opportunities for social control. Technologies including GPS, the internet, CCTV and wireless communications—many with military origins—are now being re-appropriated as the bases for new architectures of surveillance and tracking (Graham 2010). 'Everything from mobile phones to passports is fitted with microchip radio frequency tags that have the potential to turn their hosts into tracking devices' (Graham 2010: 66). In 2013, it was revealed that the American military contractor Raytheon had developed software

capable of tracking individuals' movements and predicting future behaviour by mining data from social networking websites (Gallagher 2013). The software, named RIOT, is able to extract and analyse information including the geolocation metadata with which many smartphones now automatically embed images.

At the same time, such technologies also offer new possibilities for resistance, subversion and transgression. In the West Bank, whilst Zionist map makers erase the presence and territorial claims of Palestinians in a process of cartographic ethnic cleansing (Tawil-Souri 2012), Palestinian militants use Google Earth to help determine their targets for rocket strikes (Chassay and Johnson 2007). And, in my own research in London, shoplifters and graffiti writers use Google Street View to 'scope out' potential targets. In a world of ubiquitous digital mapping, our understandings of space, knowledge and power, and how all this relates to crime and its control must be reconsidered.

Maps as a Methodological Toolkit

Not only might cartography constitute a novel area of criminological critique and inquiry, but maps and map making also afford a host of innovative research tools and opportunities that criminologists have yet to explore. In the fields of geography, psychology, sociology and anthropology, maps have long been used to document and analyse the experience and meaning of place and space (Powell 2010). Established research methods which have incorporated cartographic maps include: semiotic analysis (Wood and Fels 1986), graphic elicitation (Crilly *et al.* 2006) and 'mental' or 'sketch mapping' (Gieseeking 2013). In recent years, cultural criminologists, drawing on intellectual developments provoked by the 'spatial turn' in social theory, have begun to offer a more sophisticated rendering of the lived experience and socio-cultural complexities of (urban) space/crime (see Hayward 2004; 2012; Campbell 2013). However, this enterprise has thus far been a largely theoretical one. It is my contention that, by utilizing maps as research aids, criminologists can develop innovative and explicitly spatial(izing) methodologies with which to generate further empirical insights into this exciting new subfield.

As noted above, conventional two-dimensional and static crime maps inevitably fail to capture crime's complex spatial dynamics, and perhaps there is something naive, even futile, in any attempt to fix and objectify such a fluid and elusive phenomenon. Yet, if we look beyond the methodological conventions of administrative crime mapping, we can imagine new, more creative, revealing and meaningful ways to map crime. Deleuze and Guattari's (1987) concept of the rhizome—a dynamic, a-centred, non-hierarchical network—provides an instructive 'image to think with' here. And, in fact, critical geographers have already deployed the rhizome concept in theorizing cartographies of cyberspace (see Dodge and Kitchin 2000). Along the same lines, it is possible to imagine alternative mappings of densely enmeshed and multidimensional, criminogenic and criminalizing processes—urban (socio)spatial configurations, individual biographies, institutional dynamics and so on—that would constitute a more vivid rendering of the interrelationship between space and crime.

Furthermore, recent years have seen the increasing use of computerized 'geographic information' systems such as GPS mapping software in qualitative research (Jones and

Evans 2012). Several methodological developments with potential application for criminologists are worth considering here. Particularly innovative examples include: participatory photo-mapping projects, in which photographs are geo-tagged and made viewable on a digital map (Dennis *et al.* 2009); and walking interviews, in which audio recordings are matched with a GPS log of participants' route to create a kind of 'spatial transcript' (Jones *et al.* 2008; Jones and Evans 2012). A more experimental form of participatory mapping is exemplified by the 'bio-mapping' project developed by Nold (2009). Here, participants wear a portable device comprising a biometric Galvanic Skin Response sensor and a GPS receiver. The biometric sensor measures changes in the moisture level in participants' skin—a crude indication of emotional intensity—whilst the GPS records their location. These data are then integrated and visualized as an 'emotional map' (Figure 3): the wearer's journey is represented as a visual track superimposed onto Google Earth's 'satellite view', the height of which indicates the level of physiological arousal at a given moment. This in turn functions as a visual prompt to elicit 'detailed and personal interpretations of [participants'] bio-data' (Nold 2009: 5). In the remainder of this section, I offer some tentative suggestions as to how these methods and others incorporating maps and map making might be deployed by criminologists.

'Criminological cognitive cartography'

In a short but intriguing chapter, [Canter and Hodge \(2000\)](#) probe some of the ways in which sketch maps—participants' drawings of their mental or cognitive 'maps' (see [Kitchin 1994](#))—might offer researchers an insight into individuals' experiences of space/crime. Having asked offenders to draw maps indicating where they had committed crimes, they present four examples to demonstrate sketch maps' potential value to criminologists. Particularly interesting questions here concern how respondents choose to interpret the instructions to 'draw a map', as well as the sorts of details that they recall or choose to symbolize. Canter and Hodge offer some speculative interpretations of the maps presented, noting that, for instance, 'crimes that are a dominant part of an offender's life might be expected to dominate their conceptualizations of places and be the primary focus of the maps they draw' ([Canter and Hodge 2000: 186](#)). This idea is particularly unnerving when one considers the map drawn by a serial rapist, in which '[t]he lack of any other details ... than the rape sites and his home show how important these assaults became in defining his existence' ([Canter and Hodge 2000: 190](#)). Researchers must remain wary, however, of treating these drawings as straightforwardly 'projective', and interpreting sketch maps without any other background information can be misleading. Rather, they are better used as a focus for interviews exploring the participants' lifestyles and offending, and the emotions and conceptualizations associated with the image produced ([Canter and Hodge 2000: 187, 190](#)).

It is unfortunate that the authors did not choose to pursue this methodological sortie further, since it clearly has the potential to provide insight into individuals' experiences of crime (and control) and the spaces and places in which it occurs. What, for instance, might homeless people's drawn maps of the city tell us about the stigmatization, criminalization and spatial exclusion of the poor amidst the ongoing privatization of public space and the socio-aesthetic sanitization of city centres? And what might young people's maps of their local areas tell us about the nature of inter-neighbourhood territoriality, ethnic tensions and gang rivalries (see [Kintrea et al. 2008](#))?

(M)apping crime

The increasing availability and popularity of GPS-equipped smartphones, accessible and open-source mapping software, and social network geo-tagging offers new opportunities for researchers to engage with wider audiences and participant populations. Mappiness (www.mappiness.org.uk) is a smartphone application developed by researchers at the London School of Economics, and designed to measure the relationship between emotional well-being and environmental quality. The app asks users—research participants how they feel at random intervals throughout the day, whilst using the iPhone's GPS to record their approximate location, and its microphone to measure ambient noise levels. Whilst the research's subject is undoubtedly intriguing, perhaps even more significant is the project's unprecedented response rate: to date over 57,000 people have participated! Criminologists would do well to exploit mobile apps' versatility, their popularity and their accessibility, as well as smartphones' capacities to function as 'pocket research labs' (see [Cunnane 2011](#)). Potential research applications include mapping fear of crime through time and space; tracking the sprawling midnight 'bombing' missions of graffiti writers (a potential interview prompt); and

documenting unlawful stop and searches, wrongful arrests and police brutality (with the possibility of uploading and geo-tagging photographs and video footage).

'Bio-mapping' the 'crime-consumerism nexus'

It is interesting to think about how Nold's (2009) 'bio-mapping' might be used to map the late-modern city's manufactured landscapes of (criminogenic) consumer desire. A small but significant body of literature has detailed designers of retail environments' efforts to 'seduce the consumer through specific variations of space and place' (Miles 2010: 8; see, e.g. Shearing and Stenning 1984; Crawford 1992; Goss 1993). Consumers are often unconsciously manipulated through a host of strategically deployed environmental features—flooring patterns, seating, lighting, music and even scent—in order that they 'adopt certain physical and social dispositions conducive to shopping' (Goss 1993: 31–2). In recent years, cultural criminologists have begun to unravel the various interrelationships that exist between the values and emotions associated with consumption and consumerism on the one hand and various forms of expressive and acquisitive criminality on the other (Hayward 2004; Hayward and Kindynis 2013). Put simply, the same dispositions actively cultivated in a consumer culture, and which consumer environments attempt to induce—insatiable desire, aggressive and competitive individualism, hedonism and impulsivity—can also find expression in criminal behaviour (Hayward and Kindynis 2013). How do these architecturally induced subjectivities play out over time and space? What kind of 'bio-data' or 'emotional maps' might a drift (or *dérive*, to use the Situationists' terminology) through London's militarized post-Olympic landscape or Westfield supermall yield? And what might these data reveal to participants and researchers alike about their experiences of these insidiously contrived consumer spaces?

These methods and many more can offer researchers an insight into how people see their world and their lived social relations. What is more, maps provide an untapped opportunity for criminologists to engage with the public (see Loader and Sparks 2010). Unlike so many data sets and impenetrable academic jargon, maps are visually appealing and intuitively legible, and it is to maps' communicative power that we now turn.

Mapping For (and Against) Social Justice

The institutionalized inequalities of criminal justice and social control; the ongoing abrogation of human rights in the name of 'total policing', 'counterterrorism' and neo-liberal economic interests; hate crime, domestic violence and rape: this is all the stuff of criminology and, like it or not, there is no neat choice between academic analysis and political involvement (Ferrell *et al.* 2008: 13). If we acknowledge that criminologists have a responsibility not just to interpret the world, but to try and change it, cartography offers us a powerful tool for action research and a vehicle for promoting social justice. By reframing the world in a way that forces us to look at it anew; by making visible that which otherwise goes unseen; and by juxtaposing stark and shameful inequalities, counter-mapping asks questions deemed insignificant, inappropriate or 'difficult' by those in power (Kitchin *et al.* 2011). And the counter-mapping of the criminological landscape is already well underway, albeit not by criminologists.

A map of London's prohibition zones—in which otherwise legal activities, such as drinking alcohol, dog walking or political protest, are criminalized—has been charted by The Manifesto Club, a group that campaigns against what it calls 'the hyperregulation of everyday life' (The Manifesto Club 2012; Bowcott 2012). The map exposes the dramatic extent of these quasi-legal jurisdictions, which together cover around half of the city. What is particularly interesting is the way in which this map hijacks the visual language of conventional crime mapping, yet turns the picture on its head, rendering the city as a landscape of social control. As well as a key, the map provides further information about each of the prohibition zones, the option for users to submit reports of their own experiences, and links to relevant petitions and protest organizations, thus making explicit the project's normative ideals.

Prison Map (www.prisonmap.com) is a project which uses satellite imagery from Google Maps to visualize America's carceral epidemic. The maps creator explains that 'When discussing the idea of mass incarceration, we often trot out numbers and dates and charts' (Begley 2012). 'But what does the geography of incarceration in the US actually look like?' Often located far from population centres, prison buildings are a rare sight for many Americans (Alexander 2010: 190). By collecting and concentrating these images in the same place, Prison Map seeks to make visible this hidden penal architecture, and with striking effect: a surreal and seemingly endless grid of satellite photographs, a dystopian archipelago of incarceration.

Dronestagram (www.dronestagram.tumblr.com) employs a similar methodology, posting Google Maps satellite images of the locations of drone strikes to the social networking website Instagram. Each image is supplemented with a summary drawn from the Bureau of Investigative Journalism, which compiles reports on drone strikes in Pakistan, Yemen and Somalia (Bridle 2012; see TBIJ 2013). A typical caption reads:

At least 16 people killed and more injured in a strike by four missiles on a house near the Miranshah bazaar. Drones remained over the target for some time after the attack preventing the injured being rescued. The Pakistan government protested the strike as a violation of sovereignty, and released a statement that 'drone strikes are counterproductive, entail loss of innocent civilian lives and have human rights and humanitarian implications.' #drone #drones #pakistan. (www.instagram.com/p/BT9aNBLB6i)

There is something undoubtedly quite powerful about this drone's-eye view of covert robotic assassinations rudely interrupting an Instagram feed of friends' photographs.

Many of these projects are both critical cartography and public criminology in all but name, and point towards new opportunities for participatory action research and a more politically engaged criminology. However, such progressive mappings have their reactionary equivalent in *cartographies of intolerance and vindictiveness*.⁵ Offender Locator is an app which allows smartphone users in the United States to locate registered sex offenders living in their area. The app's developer, ThinAir Wireless, Inc., has compiled and mapped names and addresses from all 50 states' 'Registered Offender Databases', rendering them searchable by name or location. According to the developer, Offender Locator is designed to offer its users 'peace of mind', yet it is not difficult to imagine how publicizing such information might serve as a catalyst

⁵ I refer here to Jock Young's work on the 'criminology of intolerance' (1999) and the 'sociology of vindictiveness' (2007).

for vigilante justice. Numerous other websites host interactive ‘offender search’ maps, many of them produced by local and state-level authorities. Perhaps owing to the availability of offenders’ personal information, this kind of vigilante crime mapping has thus far been limited to the United States. However, in 2012, a map allegedly depicting the prevalence of ‘Muslim paedophile gangs’ in the United Kingdom began circulating on the extreme-right blogosphere (see [kafircrusaders 2012](#)).⁶ Whilst the map does not purport to show the home addresses of the alleged offenders, it nevertheless serves as icon of thinly veiled racist propaganda: ostensibly evidence of a pervasive ethno-racial crime threat. Fortunately, such cartographies of intolerance remain few and far between.

Conclusion

This article has sought to challenge criminologists to think differently about maps, to critically re-engage with cartography as an object of research, and to explore its implications for theory, method, and social and political intervention. After briefly reflecting on crime mapping’s history, the article considered the development of critical cartography and its theoretical, methodological, social and political relevance for criminology.

It was argued that criminologists must not only challenge conventional crime mapping’s efficacy as a tool for crime analysis and its strategic implications for law enforcement, but must also interrogate its epistemological basis and its hidden political and ideological functions. Furthermore, it remains for criminologists to theorize the implications of a host of other new mapping practices, particularly the proliferation of digital mapping, and their implications for our understandings of crime and its control.

It was suggested that, by using maps and map making as research aids, criminologists can develop pertinent spatially oriented methodologies, with which to generate empirical insights to compliment emergent critical and cultural criminological theorizations of space/crime. Moreover, not only are maps more visually interesting and easily accessible than dense academic articles and textbooks; the increasing popularity of GPS-equipped smartphones and digital mapping applications offers researchers a unique opportunity to engage with new audiences and potential participants.

Lastly, the article considered how counter-mapping offers criminologists a powerful tool for action research and promoting social justice. However, whilst progressive mappings provide opportunities to challenge the inequities of criminal justice and social control, criminologists must nevertheless remain vigilant against cartographies of intolerance and vindictiveness. My hope is that this article will encourage criminologists to reconsider maps’ meaning, power and significance; to innovate and experiment with new cartographic methodologies; and use maps to engage, excite and enrage the public, policy makers and practitioners, about crime, (in)justice and social control.

⁶ As of July 2013, the map had over 87,000 views. On the construction of this racial crime threat and its co-option by the extreme right, see [Cockbain \(2013\)](#).
